DETAILED ACTION

1. Election filed on 7/25/05 has been received.

Election/Restrictions

2. Applicant's election without traverse of Species 1 in the reply filed on 7/25/05 is acknowledged.
3. Claims 3,4,6,8,9, and 11-22 are withdrawn from further consideration pursuant to 37 CFR 1.142(b) as being drawn to a nonelected species, there being no allowable generic or linking claim. Election was made **without** traverse in the reply filed on 7/25/05.

Drawings

4. The drawings are objected to under 37 CFR 1.83(a). The drawings must show every feature of the invention specified in the claims. Therefore, the ball screw nut disposed in the body side tube and the motor in the axle side tube as in claim 2 must be shown or the feature(s) canceled from the claim(s). No new matter should be entered.

Corrected drawing sheets in compliance with 37 CFR 1.121(d) are required in reply to the Office action to avoid abandonment of the application. Any amended replacement drawing sheet should include all of the figures appearing on the immediate prior version of the sheet, even if only one figure is being amended. The figure or figure number of an amended drawing should not be labeled as "amended." If a drawing figure is to be canceled, the appropriate figure must be removed from the replacement sheet, and where necessary, the remaining figures must be renumbered and appropriate

changes made to the brief description of the several views of the drawings for consistency. Additional replacement sheets may be necessary to show the renumbering of the remaining figures. Each drawing sheet submitted after the filing date of an application must be labeled in the top margin as either "Replacement Sheet" or "New Sheet" pursuant to 37 CFR 1.121(d). If the changes are not accepted by the examiner, the applicant will be notified and informed of any required corrective action in the next Office action. The objection to the drawings will not be held in abeyance.

Claim Rejections - 35 USC § 102

5. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

6. Claims 1,5,7,10 are rejected under 35 U.S.C. 102(b) as being anticipated by Davis et al (U. S. Patent no. 5,060,959).

See figure 2 body-side tube 62, axle side tube 60, connecting pipe 28, ball screw 26, ball screw nut 34, suspension spring 58 attached to receivers mounted on tubes 60,62, motor 52.

Regarding claim 7, no specific rotation prevention device is discussed but it is an inherent feature of the design that the ball screw but can not rotate. If the nut was able to rotate then it would not be able to convert linear to rotary motion and vice versa. Alternatively, figure 3 discloses the same setup with a coil spring in place of an air spring.

Claim Rejections - 35 USC § 103

7. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

8. Claim 2 is rejected under 35 U.S.C. 103(a) as being unpatentable over Davis et al.

Davis et al is relied upon as above. Davis et al does not disclose mounting the motor on the axle side and the ball screw nut on the body side. It would have been obvious to one of ordinary skill in the art at the time the invention was made to mount the motor on the axle side and the nut on the body side as such is merely a design choice that does not affect the functionality of the device and is a simple rearrangement of parts. Space considerations can be a motivating factor as there might be more lateral space available near the axle as opposed to near the body.
